TNode class

We create a class that will contain the definition of the node of a tree.

private variables

    String id
    int recordNumber
    TNode left
    TNode right
    TNode parent

constructors

public TNode()
public TNode(String k, int rn, TreeNode l, TreeNode r, TreeNode p)

access methods

get and set for every private variable

toString() method

returns the identification and the record number stored in the node if the node is not **null;** otherwise the method returns the word "null"
